

Abstract of the Disclosure:

A method is described in which each subregion of a packet-oriented network has an associated item of subregion information, and, when a connection is initialized, the item of subregion information associated with an originating subregion and the destination subregion and also a requested resource are signaled. A connection that is to be initialized from one subregion to another subregion is authorized taking into account the requested resources and the available transmission system resources between the subregions.
